---

Dear Hiring Team,

I am a platform and release engineer. From 2022 to 2026 I worked at Intradiem on one enterprise SaaS platform on AWS, with customers in the US, Canada, and the UK, through its move from EC2 to Kubernetes on Amazon EKS. My work has been the path from code to production, covering Infrastructure as Code, releases, and incident response.

There, first through Coherent Solutions and then in-house, I ran releases across three delivery models, from Jenkins deployments to EC2, through a hybrid EC2 and EKS period, to GitOps with Argo CD and Helm on EKS. I owned the Infrastructure as Code for the EC2 tier. This covered Terraform modules tested in Go and released with SemVer, a Terragrunt repository that pins each environment to a module version, and the move to OpenTofu in 2026. I built and maintained the Jenkins CI/CD pipelines behind the Java, Flink, Python, and front-end services, and responded to incidents across dev, QA, and production, from triage to root cause.

Outside work I apply the same ideas in my own projects. I am building a GitOps release engine in Python that keeps release state in Git, promotes the same image digest through verification gates, and publishes its own signed, attested releases. I use AI coding agents under an operating model in which they act within defined contracts and gates and a person approves every merge. I also lead architecture, identity, and infrastructure on Cally, a multi-tenant SaaS built on Next.js, Keycloak, PostgreSQL, and OpenTofu.

Best regards,
Vadzim Prudnichenka
