---

Dear Hiring Team,

I am a platform and release engineer with six years on an enterprise SaaS on AWS: infrastructure as code, releases, and production operations for dedicated and multi-tenant EKS clusters in three production regions. I work on the path from code to production and on keeping it predictable.

At Intradiem (2021 to 2026, first through Coherent Solutions and then directly) I ran releases through three delivery models: legacy Jenkins deployments to EC2, a hybrid EC2 and EKS period during the migration, and Argo CD GitOps on EKS after it. I authored the platform's library of versioned OpenTofu modules and the Terragrunt layout that consumes them by pinned version, maintained the Terraform codebase through its monolith-to-modules migration, maintained the Jenkins pipelines behind Java, Flink, ML, and front-end services, and handled incidents across every environment tier through resolution and root cause analysis.

Outside work I build the same ideas in code. I develop a GitOps release engine in Python, a project in active development: release state lives in Git, each merge produces one candidate, the same digest is promoted through gates that must prove they can fail, and rollback restores a recorded state. It releases itself through its own pipeline: a multi-platform image signed with Sigstore cosign, an SPDX SBOM attestation and build provenance, checked by an independent verify job from the digest alone. **Cally** is a multi-tenant B2B SaaS where I lead architecture, identity, and infrastructure: Next.js, Keycloak OIDC, PostgreSQL, OpenTofu. I also work with **AI coding agents** under an explicit operating model: I plan and review, agents execute within contracts and gates, and I approve every merge.

Best regards,
Vadzim Prudnichenka
